Note: Estimated savings by condition are accomplished by meeting recommended clinical goals: A1c < 7% (T2 diabetes); blood pressure < 130/80 mm (hypertension); reduced LDL (high cholesterol); increased control & controller Rx use (asthma); viral suppression (HIV); and fewer people with reduced limitations (arthritis). www.fightchronicdisease.org/pfcd-in-the-states

AMONG NON-WHITE PATIENTS, BETTER MEDICATION USE COULD SAVE BILLIONS IN MEDICAL SPENDING (OVER 10 YEARS):

\$17 MILLION savings from viral suppression among people with HIV

savings for people with arthritis

TO WHITE PEERS

\$10.5 BILLION OVER 10 YEARS

Note: Health disparities estimates measure the savings if people of color had the same level of disease control as Whites of the same age and insurance status. Health equity estimates measure the savings if all people achieved recommended targets for disease control.

Achieving health equity can be advanced by improving access, addressing social determinants of health, and overcoming structural racism. By removing barriers to care and treatment, we can overcome health disparities, advance equity, reduce costs, and improve overall health.
